

# Storm Surge Hazard Map (Inundation Duration)

A storm surge is a phenomenon that sees a significant rise of sea level due to low atmospheric pressure such as typhoons. When the sea level remains high and hampers the flow of the river, even Itabashi City, though relatively inland, are assumed to be inundated.

This hazard map is based on:  
Storm Surge Inundation Simulation Area Map of Tokyo  
**Date of announcement**  
March 30, 2018  
**Main producer of inundation simulation**  
Tokyo Metropolitan Government  
**Simulated situation of storm surge**  
Center pressure simulated at 910hPa at time of typhoon strike  
**\*May differ from the actual inundation situation (inundation range and height).**
